Peerlink Group Supported  
 Public and Private Guide System and Service

Tour guide systems are used when normal conversation between a presenter and listeners is difficult. Whether speaking to a large group of people outdoors, a tour in an area with high ambient noise, or not wanting to disturb other people in the same environment, a tour guide system helps you provide a professional service. A tour guide system allows the guide to be clearly heard without having to strain their voice, while reducing frustration and confusion for their clients.

Tour guide systems are ideal for portable **simultaneous interpretation systems** in bilingual meetings. Multiple channels enable up to different languages to be translated simultaneously for international conferences. The interpreter simply hears what is said in the meeting/conference and whispers the translation into the transmitter microphone. The delegates then hear this translated message instantly without disturbing others.

Usually, a tour guide system consists of a microphone transmitter for the presenter, receivers with headphones for the audience and a charger storage case.

Frequency:	470-490 MHz (Can be customized)
Audio Input:	Microphone/Audio (Line in)
Output:	Earphone/Audio (3.5mm)
Channel:	100 channels
Distance:	100-150 meters
Power Supply:	Built-in Lithium Battery
Dimension:	70mm X 50mm X 17mm
Weight:	50 Grams Including Battery
